

- Databricks Repos provides source control for your data projects by integrating with GitHub providers in workspace.
- To connect Databricks to any Git providers, you need username and personal access token.
- Personal access token generated needs to be copied once they are visible as we can't copy them again.
- You can create separate branch or merge changes from branch to another.
- Pulling changes regularly is important to avoid conflicts and especially when multiple developers are developing on same branch.
